

Download A Course On Integral Equations 1st Edition

Online homework and grading tools for instructors and students that reinforce student learning through practice and instant feedback. Equations often contain terms other than the unknowns. These other terms, which are assumed to be known, are usually called constants, coefficients or parameters. An example of an equation involving x and y as unknowns and the parameter R is $x + y = R$. When R is chosen to have the value of 2 ($R = 2$), this equation would be recognized, when sketched in Cartesian coordinates, as the equation for a line.
