

# **Download Moon And Sun Lesson Plans First Grade**

To introduce images and models of the Earth, moon, and sun I show a PowerPoint that I created with lots of graphics to show my students examples of the Earth, moon, and sun. This builds background knowledge so that when they see these images over the next several lessons they will know which one (Earth, sun, or moon) we are talking about. Science is often a favorite subject of first grade students. Find out how much they already know about the sun and then plan some entertaining and enlightening science projects that will help them learn even more about our favorite star. Energy from the Sun - Lesson Plan In this lesson, students learn how the sun affects how things are heated here on earth. Through an experiment, students track and compare the temperatures of water, soil, and air that are located outside in a shady location, outside in a sunny location, and inside the classroom in a shady location. In the previous lesson the students described the sun, moon, and stars. Students need at least one lesson to introduce the content and allow them to really develop an understanding of the sun, moon, and stars before analyzing or predicting any patterns. - Moon And Sun Lesson Plans First Grade
